

Plant Health Data Tiles

Purpose

These tiles appear in the app to give users an overview of key environmental and care-related metrics affecting their plant's health. Each tile represents a data point or trend we track through sensors or user inputs (e.g. watering, fertilization). The goal is to help users understand the current state of their plant, identify problems, and take timely action.

Displayed Parameters

Tiles cover the following categories:

Trend
↑ 12 %

Avg. hours of light
8 h 14 min

Last watering
Slightly Over

Next watering
29.03.24

Ø Range
8 °C difference

Median
24 °C

Last logged action
01.04.25

Next fertilization
29.03.24

pH Level last log
5.5 pH

Next Repotting Date
29.03.24

Light

- Light Trend (%): Shows % change based on the selected time window. Calculated by comparing the current period with the preceding one (e.g. this week vs. last week).
- Avg. Hours of Light: Total average daily light within the selected time window (e.g. week, month).

Moisture

- Shows the impact of your most recent watering by indicating which soil moisture threshold was reached afterward. This helps you understand if you watered too little, too much, or just right. The tile reflects the last rise in soil moisture and the corresponding threshold it reached. A watering cycle is counted when the total moisture increase is at least 10% two data points.
- Next Watering: Scheduled or predicted based on last input and moisture trend.

Temperature

- Median Temperature: Average of daily median temperatures within the selected time window.
- Ø Range: Average temperature difference between highest and lowest value

Fertilization

- Next Fertilization: Suggested date based on the last logged event and care intervals.
- Last Logged Action: Most recent user action date.

pH & Repotting

- Last Logged pH: Most recent pH value entered by the user.
- Next Repotting Date: Based on last repotting event and plant needs.

Too much	Zu viel
Slightly Over	Fast zu viel
Good	Gut
Just enough	Ausreichend
Too less	Zu wenig
