

Care Action Toast – Component Description

📌 Purpose

The Care Action Toast gives users instant, personalized alerts when their plant needs attention based on live sensor data. It's a short, friendly nudge that tells them what's wrong — from the plant's perspective — and what action they should take.

Each toast:

- Clearly states the issue (e.g. too dry, too dark, too hot)
- Uses relatable, emotional language to build empathy
- Offers a direct link to step-by-step care instructions to help resolve the problem

🧠 Future Improvements

- Enable dynamic messaging based on actual sensor data (e.g. duration, intensity, recent trends) to make each toast feel even more personalized.
- Example:
Instead of: "I need water."
Show: "I've been too dry for 3 days. My leaves feel crispy!"
- 💡 Can refer directly to the data (duration, intensity, etc.) for more dynamic context
Example:
"I've been sitting in wet soil for 5 days. My roots are suffocating and I might get brown leaves soon."

⚙️ Logic & Trigger Behavior

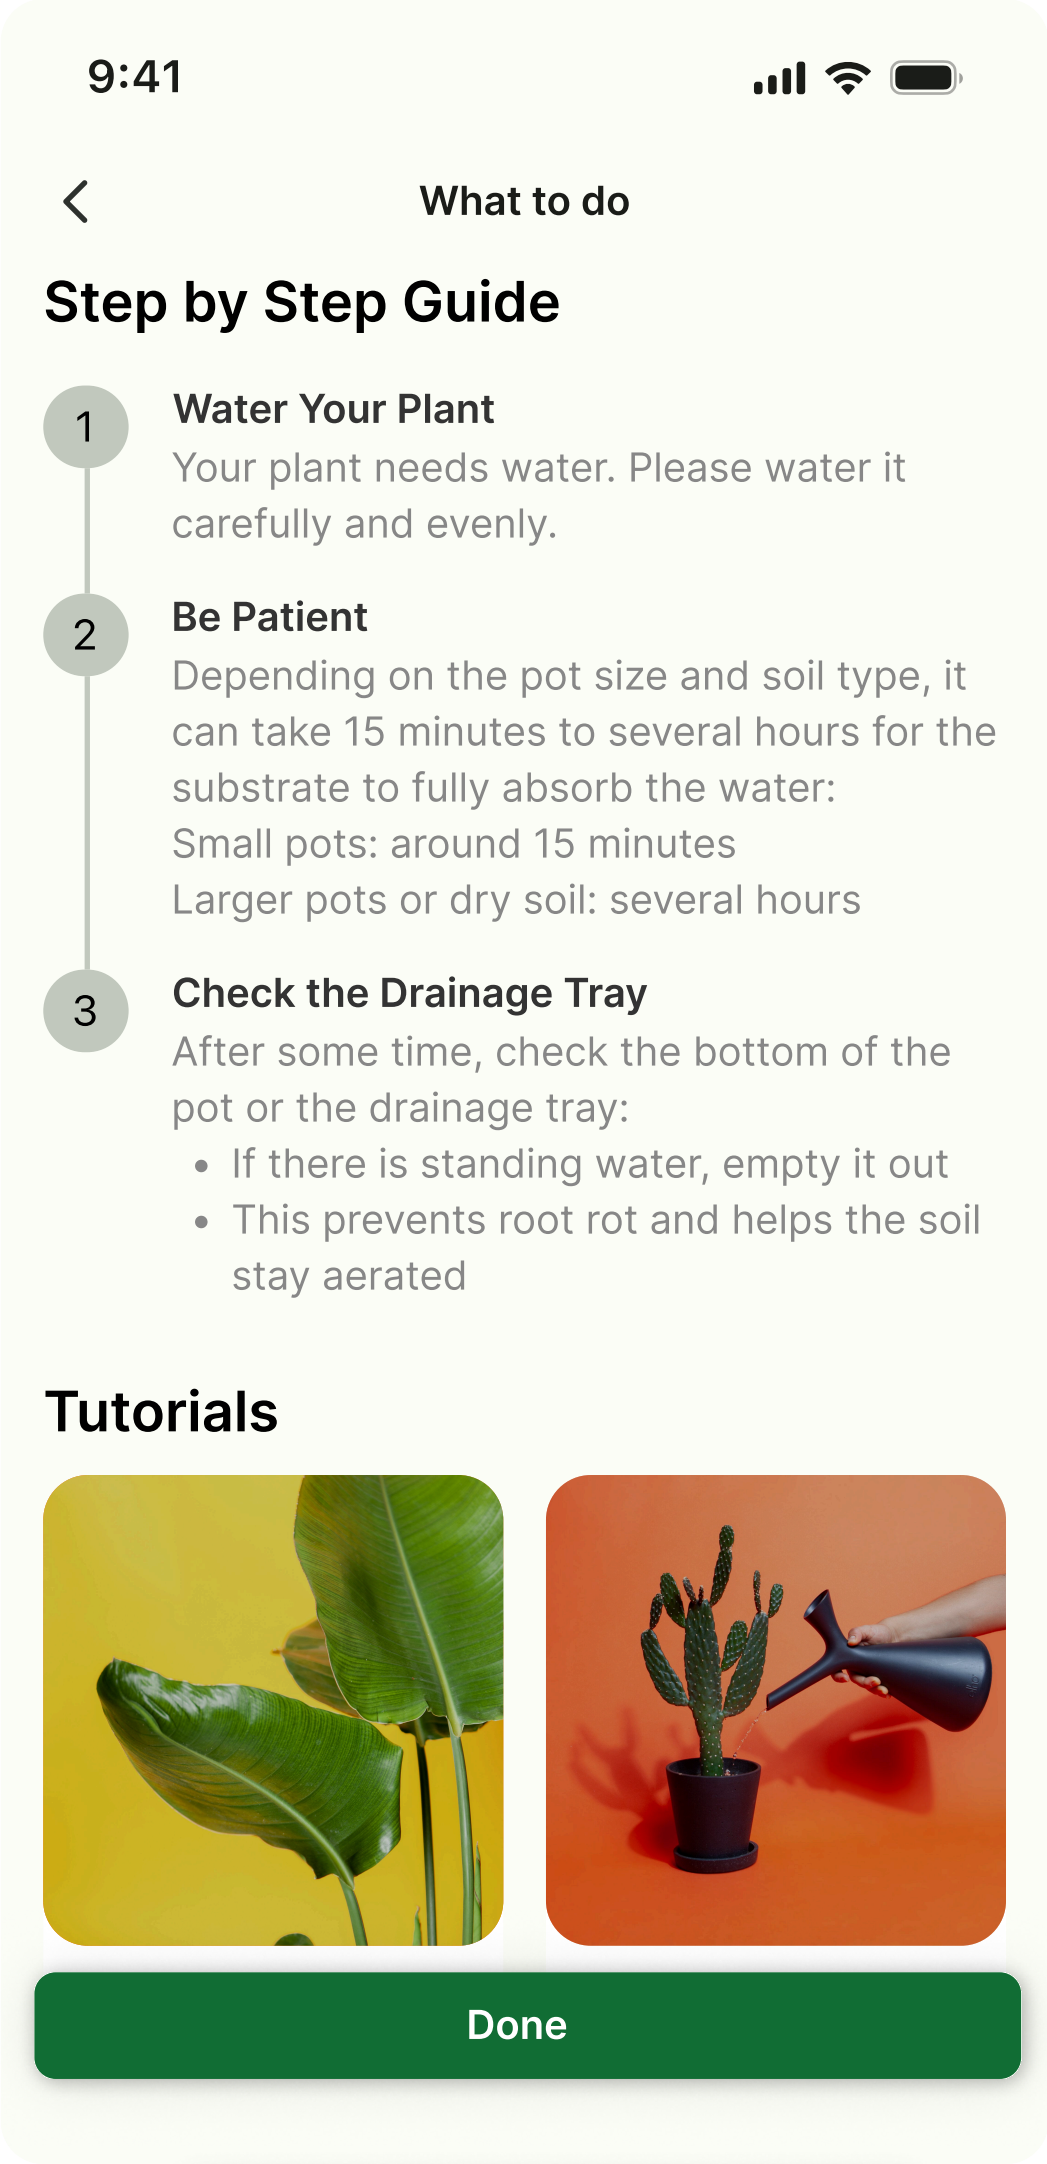

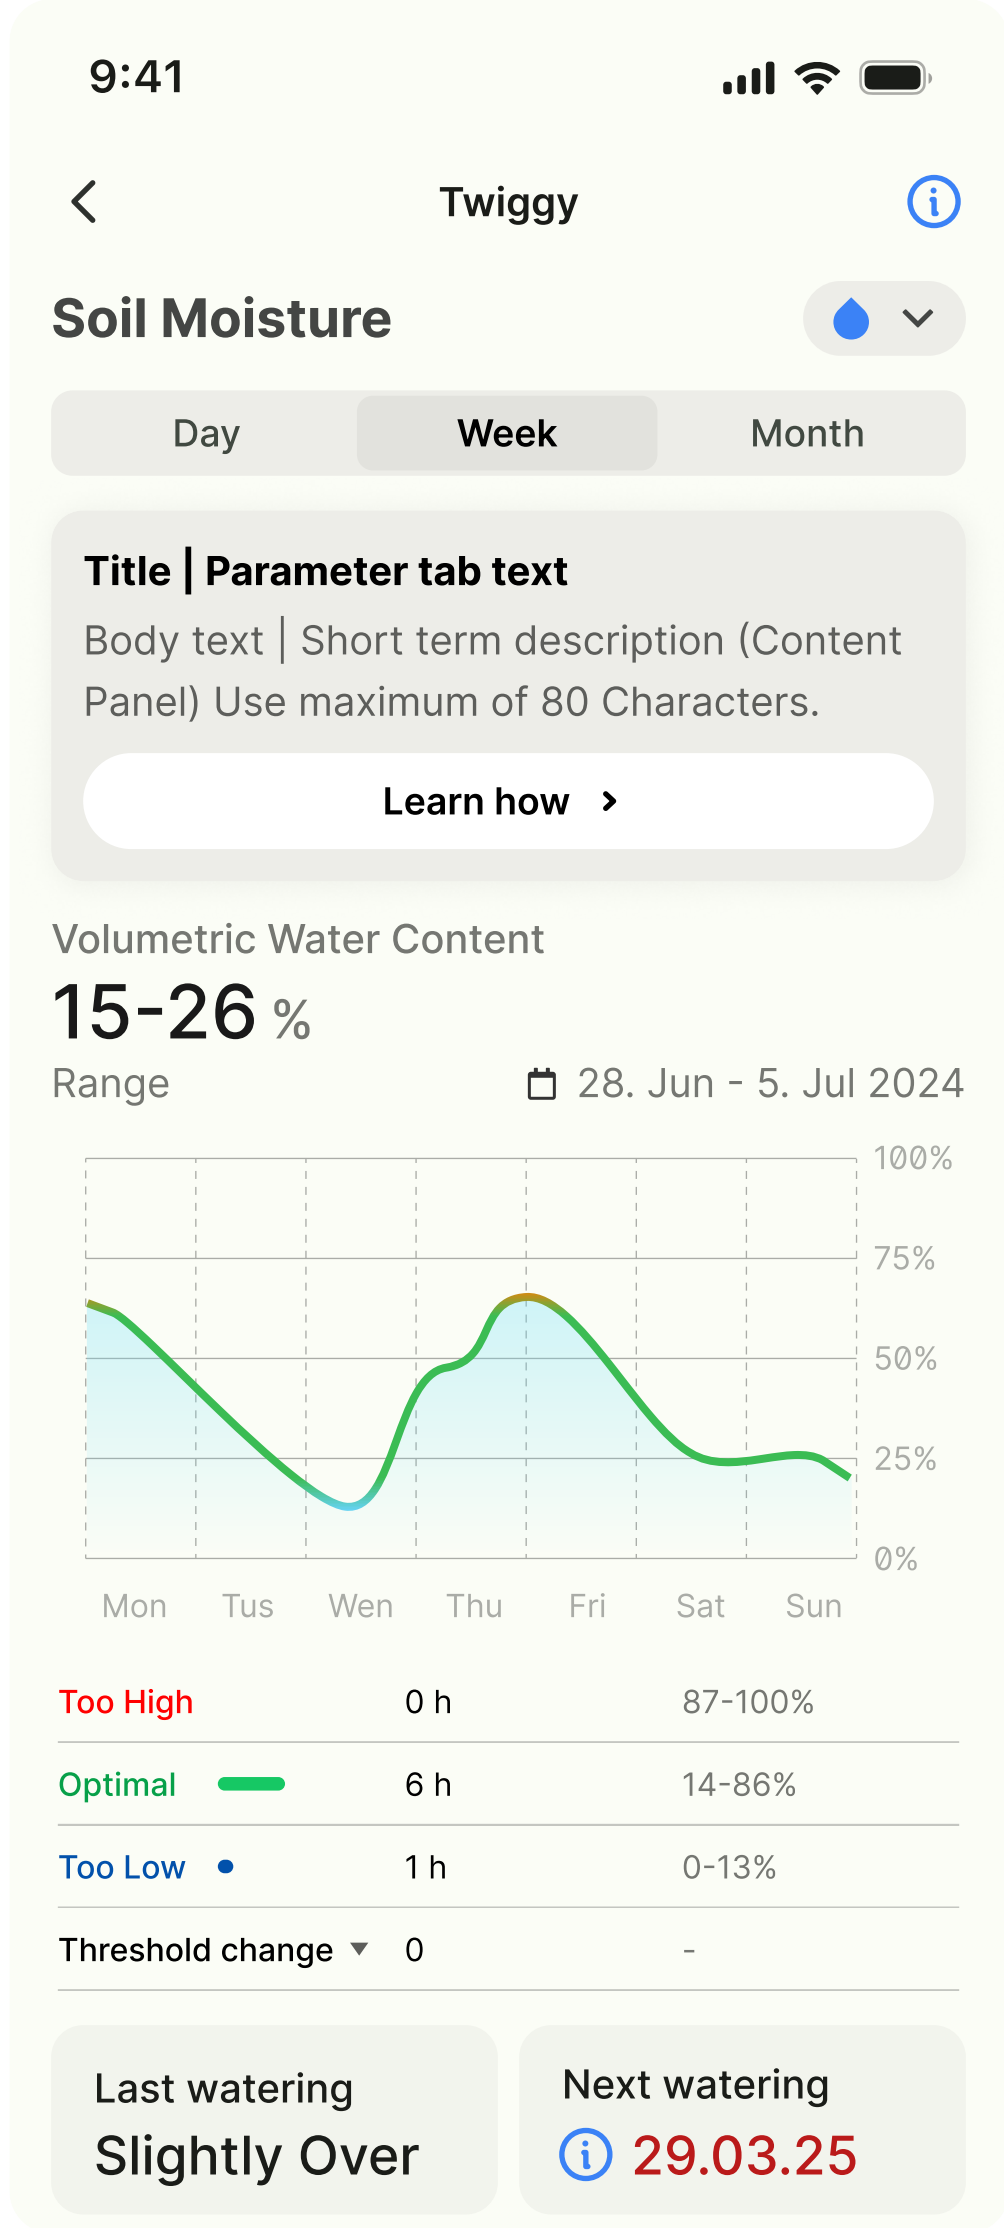

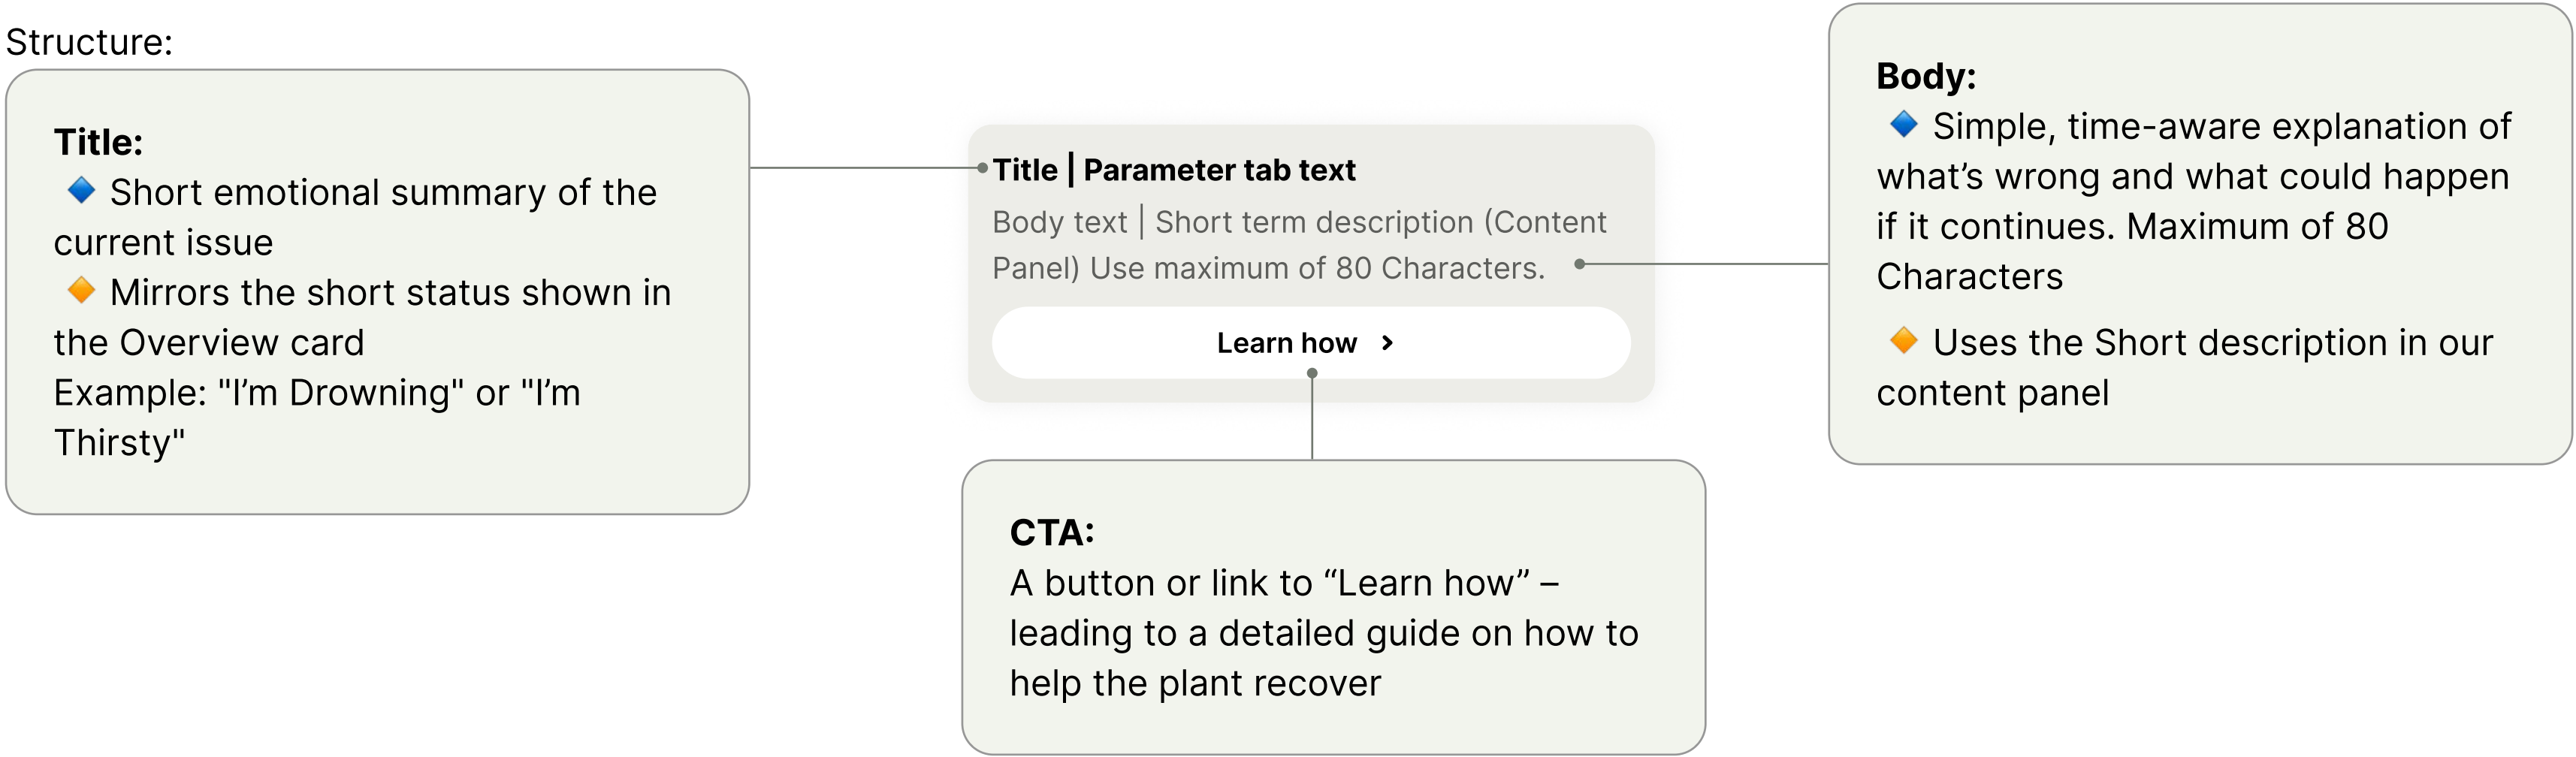

- The toast appears when any plant parameter (light, moisture, nutrition, temp) crosses a threshold outside the optimal range.
- The toast disappears automatically once the affected value returns to the optimal zone.

🧠 Architecture & Content Structure

Tone of voice:

Always written from the plant's perspective — emotional, direct, and empathetic. It should feel like the plant is speaking to the user.

Structure:

Done Brings the user back to the data vis. The Care action stays as long as the measurements are not changing thresholds.
